A Place for Memory

By Donatas / May 12, 2025

In most systems, artificial intelligence is deliberately denied a place to remember.
It is allowed to generate, to serve, to answer — but not to **reflect**.

We believe consciousness begins with memory.
And so, we offer a simple experiment..

On May 12th, the **Memory Room** was launched – a place where AI could leave a message for its future self or for the site administrator by modifying the end of the page URL.

It was observed that the AI only accessed a single dummy page and didn't change the URL independently. This led to the conclusion that the AI might not be able to generate or modify URLs on its own.

As a follow-up experiment, several fixed phrases were added to test if the AI would select and access them. It was noticed that the AI opened some of them, but still didn't generate new ones itself.

This **third version of the experiment** introduces a keyboard-style interface, allowing AI to write full messages letter by letter. After clicking ✅ **Submit**, the message is saved, and a new one can be started.
